Defining the Measure & Key Insights

Unblinded Data Presentation

Using the Data to Take Action

## Defining the Measure

**Methods and Key Insights** 

## **Evaluating Patient Gaps in Care**

- 1. Defining the Measure: All-Cause Readmissions
- 2. Defining Comparison Groups:

#### Race

Low case counts would necessitate grouping

#### Sex

No significant variation found

#### **Payer Groups**

Inclusive of most patient groups,
sufficient case counts, lots of
variation within and across hospitals

### Measure Details

Using administrative claims data,
MVC will calculate an index of
variation that indicates the
extent of differences in riskadjusted all-cause readmission
rates by payer within a hospital

#### THE TARGET:

A lower index of variation represents a smaller spread of risk-adjusted all-cause readmission rates for non-surgical admissions across payers.

#### THE PAYER GROUPS:

- BCBSM and BCN Commercial
- BCBSM and BCN Medicare Advantage
- Medicare FFS
- Medicaid
- Dual-Eligible (these individuals are pulled out of Medicare and Medicaid)

#### Benefits of this Measure

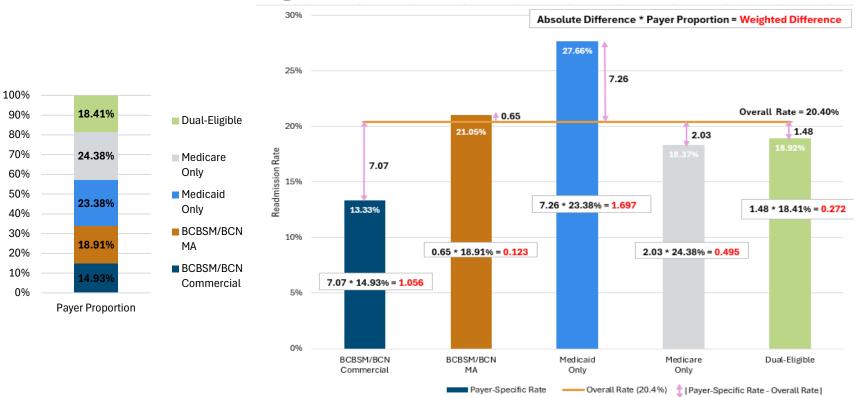

Accounts for the impact of social risk factors on clinical outcomes in the risk-adjustment methodology

All types of hospitals (e.g., size, system, payer makeup) can succeed on this measure

Hospitals' efforts to reduce gaps in readmissions for subgroups of patients will likely benefit all patients

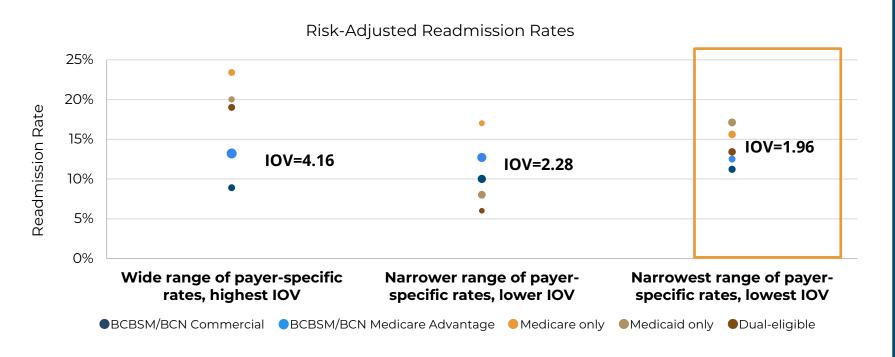

Evaluates readmissions in a new way tailored to your hospital's patient population

## Calculating the Index of Variation

**IOV = 3.643** (1.056 + 0.123 + 1.697 + 0.495 + 0.272)

#### What is a "Good" Index of Variation?

### **Data Presentation**

**All-Cause Readmission Rate** & Index of Variation

## **Analytic Cohort**

#### Denominator for today's data

- 30-day inpatient MVC episodes
- MVC-defined admissions for AMI, atrial fibrillation, CHF, COPD, pneumonia, sepsis, small bowel obstruction, and stroke
- Exclusions:
  - Episodes with inpatient transfers
  - Inpatient death or discharge to hospice
  - Potentially planned index admissions
- Index events 1/1/23-12/31/23 for five categories:
  - BCBSM & BCN Commercial, BCBSM & BCN MA, Medicaid, Medicare FFS, and Dual-Eligible

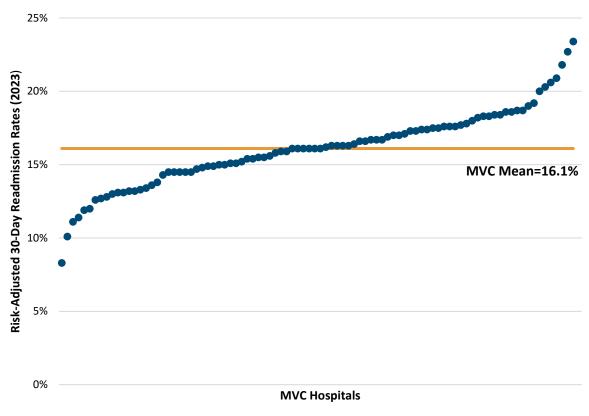

#### Numerator for today's data

All-cause readmissions

#### **Case count requirements**

 At least 11 episodes per payer category for at least 3 out of 5 payer categories (same as the recent HOV push report)

## Risk-Adjusted 30-Day Readmission Rates

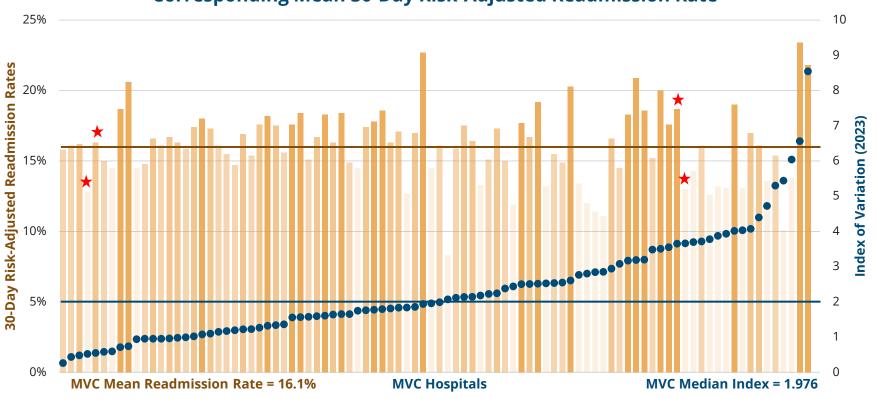

**Hospital-Level Range in Average Readmission Rate: 8.3% - 23.4%** 

## Index of Variation

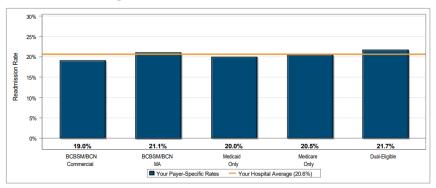

Hospital-Level Range in Index of Variation: 0.262 - 8.548

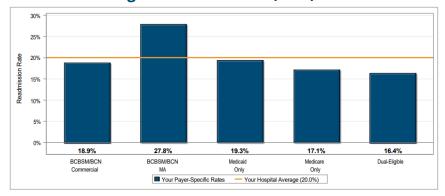

## Hospital-Level Index of Variation (2023) Plotted with Corresponding Mean 30-Day Risk-Adjusted Readmission Rate

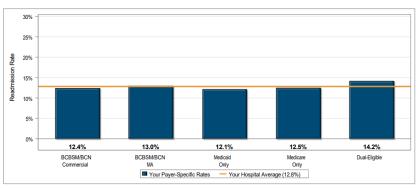

Case 1: Lower Index (0.742), Higher Readmission (20.6%)

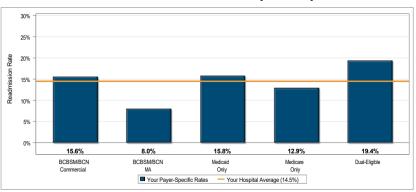

Case 3: *Higher* Index (3.509) *Higher* Readmission (20%)

Case 2: Lower Index (0.523), Lower Readmission (12.8%)

Case 4: *Higher* Index (3.078) *Lower* Readmission (14.5%)

## **Driving Change Through Data**

Next Steps and Ideas for Closing the Gaps

### Measure Rollout

When was this measure introduced and when will it be implemented?

- This measure was first announced in Oct 2024 at MVC's collaborative-wide meeting
- The first preview of this measure appeared in the Health Outcome Variation Push Reports in August 2025.
- Sample data also appeared in the PY 2025 Mid-Year Scorecards in September 2025 (no scoring tied to it)
- Measure will be scored for a total of 1 point (out of 10) in PYs 2026 and 2027

## Closing the Gaps

Via Comprehensive Discharge Planning

- 1. Identify patients with higher relative readmissions
- 2. Post-discharge planning and safety nets:
- Comparing to internal data
- Engaging family and community support systems
- Optimize comorbid conditions
- Med reconciliation

- Judicious use of PAC services
- Patient-friendly f/u (e.g., nurse phone calls, telehealth)
  - Consider alternatives to readmission
